

CDS Product

Please Read;

Below are our suggestions for maintaining the efficacy of the CDS product;

The “Active Mineral Solution” or CDS Solution, MUST be kept out of direct sunlight, as the ultra violet component within sun light will break down the active molecule.

When seeking to store the CDS solution for any given amount of time, it is best to keep in a cool environment (the fridge is a best option).

Protocol 115: With this protocol 1 -2ml of the CDS Solution is added to a glass of water (6 –8 ounces) & then consumed every 15 minutes for a period of 2 hours prior to breakfast (or conversely in the afternoon) for a duration of roughly 20 days. A Measuring syringe is included within the kit to assist with dosage. Please read through the Protocol 115 below as doses will vary depending upon the application.

Note: If using DMSO then then one will add 3 – 5 drops of DMSO to each dose of CDS Solution.

Remember: Be sure to tightly cap the CDS bottle after using – also keeping out of direct sunlight & in the fridge when not in use...

Note: When using either the MMS or the CDS Solution the body will be eliminating toxins at a higher rate – so it is suggested to consume

between 2 – 3 litres of clean water daily
minimum.
